Portfolio Prototype:

The prototype utilized two different API's for the W4 prototype project. The two API's were https://raw.githubusercontent.com/FEND16/movie-json-data/master/json/movies-in-theaters.json and https://jsonplaceholder.typicode.com/users . The first link had a list of movies in 2018 with different information for each film. The second link was a database of random people with all their contact information. On each display of data there was a h1 tag for the title of the page. We pulled multiple images from the second button to reveal the posters from each movie. The final button allowed users to see any extra information they needed on their film choice.
